

FOR IMMEDIATE RELEASE

Adoil Announces H2S Detection System

TITAN SENTRY- Killer Gas Detected Before It Spreads

Calgary, Alberta, May 1, 2010- Adoil Inc. today announced the availability of a new well site detection product TITAN Sentry (H2S Early Warning System) which has immediate H2S response capabilities at all producing wellheads. The availability of the TITAN Sentry has provided toxic gas detection for all oil producers and landowners.

Combined with an H2S transmitter and a wellhead containment, the TITAN Sentry becomes a strong environmental protection system. Knowing the exact amount and location (including windy day) of the smallest H2S leak from a producing wellhead is indispensable to oil producers and the ERCB, it also provides peace of mind to landowners. When immediate action can be taken on the smallest H2S leak, it's common knowledge that the occurrence of bigger H2S releases could be eliminated.

"The TITAN Sentry is experiencing excellent development success," said Marty Matthews, president of Adoil Inc. Many oil producers in southeast Saskatchewan have already benefited from using TITAN Sentry. Numbers of inquiries from field offices and landowner groups in northwest Alberta have recently received.

The TITAN Sentry is an environmental product and is part of Adoil's commitment to deliver the safety and peace of mind to the oil and gas industry.

Founded in 1986, Adoil Inc. has become the largest wellhead environmental products firm in Alberta Canada. The company offers a wide range of stuffing box containment systems that prevents soil staining and groundwater protection- Always on site and on the job.
